DHY House was formulated with the cultural techniques of the Thai Nguyen region in Vietnam to celebrate the traditional passive cooling methods, combatting the region's high temperatures. The precedent's location on a flat plane heightens the importance of architectural features to manipulate shadows and thus controlling the in-home climate (Abdel, 2023).

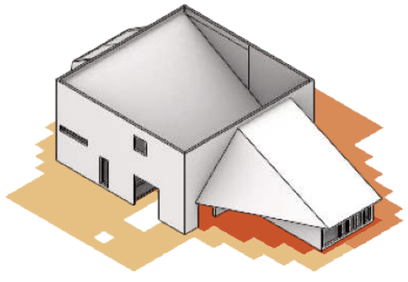

Studying shadows and sun paths in the location of the precedent is essential to inform these architectural features. This is hence why it is implemented in the early stages of the design process and utilised in the industry. AHL Architects' optimisation of varying angles of the roofing features to optimise shadows keenly highlights this.

Massing Diagram

Three rectangular prisms are added to the main cube

Excess mass is removed from the internal cube

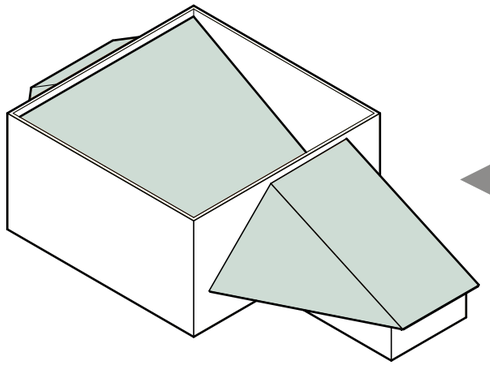

Sloped mass is removed from the joined rectangular prisms

Legend

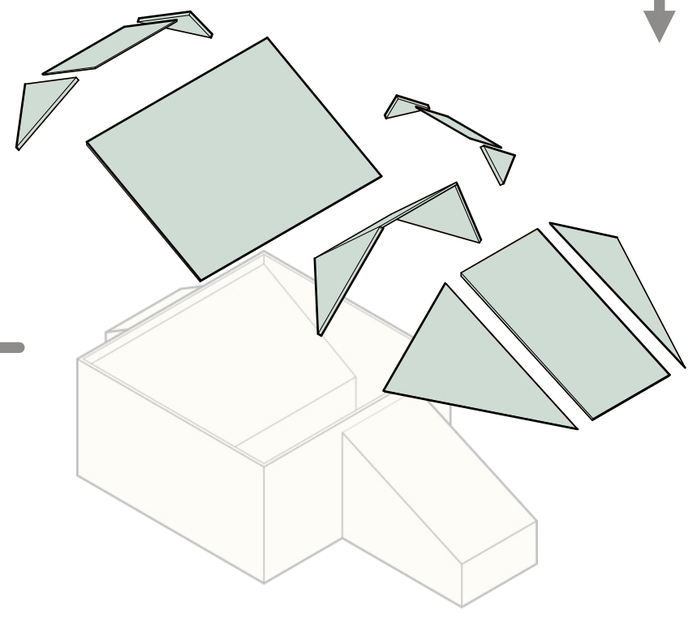

Addative Massing Subtractive Massing

AHL Architects' massing strategy conveys a substantial separation of public vs private spaces, more specifically residential vs commercial spaces. This is evident in the monolithic concrete walls dividing the public area of the café from the private residence (Barandy, 2023). This feature generates a shielded and connected space.

Formulating massing diagrams is highly valuable when designing buildings with complex geometry and specific interconnection between spaces. This is why is was used by MVRDV (2015) for the Theater Aan de Parade to communicate interconnectivity of performance stages, spatial circulation and overall geometry.

Roof geometry is joined to building body mass

Roof geometry is shaped at optimal shade manipulation angles

DHY House's Architectural Promenade is centred around the Northen Vietnamese cultural and social sanctity of the porch as a meeting place (Barandy, 2023). As communicated in both the programmatic and circulation diagrams, the porch is both the barrier for the occupants living space and the communal hub. This is promoted by its natural surroundings and optimised shade. The spatial connection within the house also promotes circulation though this meeting place.

Circulation and programmatic analysis are important due to their link to the functionality of the house and not just its form. How a space is used and accessed is crucial for insightful and complete design. Undertaking these analyses informs future design choices, ensuring an optimal end product.
